Self-contained concrete plant on a single wagon

The quality of the concrete used in railway infrastructure is crucial. Its permanent availability in a tunnel or isolated tracks is extremely important. To meet these requirements, Ateliers d'Occitanie successfully delivered a 450 m long concrete train with a capacity of 250 m³ per day for the Crossrail construction site in London. The company is currently developing new onboard concrete mixing plants: a concrete wagon with a capacity of 12 m³, a concrete trainset on two wagons with a capacity of 24 m³ and trains on several wagons with an capacity of 60 to 300 m³.
