## PIS Wi-Fi 2.0

Passenger information live on smartphone and tablet

With the current generation of the Wi-Fi system, GSP has developed a new vehicle interface: PIS Wi-Fi 2.0. This innovation enables railway companies to inform their passengers better by linking passenger information (PIS) with the GSP Wi-Fi. The benefits are obvious: Passengers can receive travel information, such as arrival forecasts, connections or track changes directly from the vehicle on their mobile devices. This connection to the on-board computer provides information in real time and is independent of the current network coverage. Passengers can thus always access travel information. GSP has a broad Wi-Fi portfolio: from routers for buses and trams to the equipment in double-decker trains with systems for Wi-Fi and entertainment.
