Tension bands for tank systems

HoKon tension bands made of strip steel for fastening pressure vessels and fuel cells

The company produces tension bands made of strip steel for fastening pressure vessels and fuel cells used in hydrails. By using tension bands from HoKon e.K, the components are protected from unavoidable operating influences such as vibration, shock loads and changes in pressure. The use of tension bands leads to a balanced pressure distribution. Thus, less energy is consumed and a better performing degree of efficiency is ensured. Furthermore, as a reliable partner to the railway industry, HoKon e.K. is working towards IRIS certification in September 2018. HoKon e.K. is a supplier of hinges, tension bands and locking possibilities in diverse forms. Customized component engineering is also possible.
