Enhanced train-to-trackside communication systems

COMESVIL SPA

The FAST-TRACKS solution

Among its railway automation components, COMESVIL SPA now presents its innovative solutions to support railway signaling through the design, development, and management of train-to-trackside communication systems. The FAST-TRACKS radio system provides a continuous, high-capacity, bi-directional, train-to-trackside data communication system that is capable of high-resolution train location determination and automatic train control for transit authorities. It delivers broadband services for vital and non-vital applications with no session loss by exploiting several wireless communication standards (Wi-Fi, Long-Term Evolution, LoRa). It also provides complete equipment redundancy to avoid any impact on the system in case of a single fault.
