Real-time turnkey solutions for automatic passenger counting for analysis of the people flow

Load graph for the complete line over a selected period

ACOREL solution integrated in Marseille transport network

The ACOREL automatic counting solution relies on sensors installed on the vehicle doors, which record the number of passengers getting on and off in real time. The data collected, enhanced by other systems (VMS, TMS, GPS, etc.) are then processed and analyzed by the software Focus on Board, which produces standardized or custom reports. This solution helps to: fight against fraud, manage and optimize the transport network and human resources, ensure a fair distribution of revenue, inform passenger in real time and deliver factual arguments for communications.
