Next generation of Roediger wastewater disposal systems

Roediger suction pistol type UP7

Automatic Roediger train valve type AV183-40

For almost 30 years now, Roediger wastewater disposal systems have been proving their efficiency in service depots of Deutsche Bahn and other railway companies. Now, for the first time Aqseptence Group presents the next generation train valves and extraction pistols for the automatic extraction of toilet wastewater from trains during InnoTrans trade fair. These, once again, have the top quality that Roediger is well-known for. The new valves are cost-efficient – with low weight and a compact design – and allow for drip-free and odourless wastewater extraction, with easy and intuitive handling. Such a drip-free and odourless Roediger disposal system also ensures that there is an optimum level of operator safety at the workplace, and automation of the extraction process prevents any potential mishandling. Roediger suction pistol type UP7
