

A new pressure control valve for tough working environments

The ED05 Rail is ideally suited for use in trains

The pneumatic specialist, AVENTICS, presents the ED05 Rail designed for railway technology: a new pressure control valve for special demands. In trains, pressure control valves regulate, for example, the brake cylinder for comfortable braking or work as an air spring control valve at the vehicle entrance height at each platform height. Pressure regulators of the ED05 series combine control electronics, pressure sensors and direct drive using proportional magnets in a closed unit. Due to the robust components made of die-cast aluminum and special steel alloys, the ED05 Rail optimally fulfills the requirements and standards in railway engineering.
