## New EWKO 45° product group

The new EWKO 45° elbow fitting with taper from EXMAR

EXMAR has added a new product group to its standard range. The adjustable EWKO 45° elbow fittings with taper and O-ring open up new possibilities for alignment in the system. It features the limited tightening distance with low torque of the robust taper fittings. Users therefore benefit from reduced assembly work. With an own make-to-stock production, the company can guarantee the usual high quality standards and delivery availability. The 45° design is particularly in demand in connection with high-pressure hydraulic hoses. But also in low-pressure applications, e.g. in the railway industry, and in tight installation conditions, the customers like to use elbow fittings. Currently, the EWKO 45° fittings are installed in bogies.
