System Development in a Complete Package

Assystem provides system engineering, development and testing of high-performance electronic, software and mechanical systems, and for decades has been a trusted development partner to leading manufacturers of trains, trams, subways, command and control systems, as well as railway and infrastructure companies. Typical aspects of projects are their scope and depth: clients entrust to Assystem transportation specialists complete work packages and product development. References include the development and testing of a cyber-security concept for a vehicle manufacturer; a typical Rail 4.0 issue that also leveraged IT security experiences from other Assystem business units. As was the case in another example, the EN50128 certification for the subway in Riyadh, Assystem's competencies makes it a sought after partner.
