E-paper display greater than ever

The new 31.2 " e-paper display in Vienna

In addition to the already established 15.4 " displays with various equipment options the new 31.2 " e-paper display will also be presented at this year's InnoTrans. The large display can replace the classic DPI display at stops and shines with very low power consumption and excellent readability in all lighting conditions. Due to the fully graphical display the layout and presentation content can be freely designed and the application possibilities are almost unlimited. The first customer projects have already been successfully completed in Austria together with the partner company next urban technologies gmbh. The new 31.2 " display is available in both single-sided and double-sided versions with and without lighting.
