Dynamic wheel load measurement

Dynamic wheel load measurement system WILOC

The dynamic wheel load measurement system WILOC is optionally equipped with distance sensors, which measure the position of the wheel across the road. The influence of the lateral axle displacement to the wheel loads left and right can be compensated. This produces better results and leads to higher measurement reliability. WILOC determines the wheel loads of multiple and articulated trains also of single wagons and locomotive before they will be put into circulation. In combination with a measuring track, geometric logs, wheel loads, axle loads and vehicle mass can be defined. WILOC is a powerful instrument used by railway car manufacturers and maintenance workshops.
