IRMA 6 makes it easy

IRMA 6 – next generation of passenger counting; simulation of installation

IRMA 6 Passenger Counter

Even simpler, more intuitive and flexible: IRMA 6, the new generation of iris sensors for automatic passenger counting, will make its debut from September 18 to 21 at InnoTrans in Berlin, the original birthplace of iris GmbH. To allow more flexible mounting positions and heights, the counting sensor was fitted with an advanced technical feature in lighting technology. The implementation of the ITxPT sensor communication achieves maximum standardization. IRMA 6 = Plug & Play. Apart from technological advances, the company iris is committed to new and improved product design. Cleverly devised details save time and thus cost on installation. A user-friendly web interface allows direct access to the system using a browser. In the development of the sixth generation of IRMA sensors, iris not only intends to expand the options of the technology, but also aims to create an intuitive product which shortens and facilitates all work steps on all levels of use.
