Eco-friendly drives for railcars and locomotives

MTU service solutions help optimize operations

Hybrid PowerPack will also be available for EU Stage V

MTU will be unveiling its rail drive solutions for compliance with the EU Stage V emissions standard coming into force from 2021. MTU will be able to deliver Stage-V-compliant Series 1800 and 1600 PowerPacks and Series 4000 locomotive engines in time for the new requirements. The prototype of a Series 1800 Stage V PowerPack with a system combining SCR and particulate filter will be on show. A new feature of PowerPacks is their modular structure, which will help contribute to even faster delivery times and continual improvements in quality. A hybrid PowerPack version incorporating battery packs and an electric motor for rail travel with zero local emissions will also be available.
