Thermomanagement HeliosFFB – DPF after SCR

Main component Thermomanagement HeliosFFB

The intelligent control of thermal management system HeliosFFB allows a combination of in-house developed DPF and SCR systems and third-party products. This finally enables the combination of thermal management HeliosFFB and DPF after an OEM SCR system. The hardware allows the use in extreme environments with very small space requirements of the components. Data logging of exhaust backpressure and exhaust temperature are VERT compliant. The controller additionally ensures the operation and monitoring of safety components, e.g. a security bypass. This ensures that the vehicle can independently leave a danger spot every time. All relevant data is displayed to the operator on a coloured display.
