

Railalert – Safety for man and machine

The Railalert system consists of a signal light and an alarm station

As a world first, FRIKE electronic AG presents the Railalert system. The system consists of a signal light and an alarm station. The lamp serves as a visual warning in the event of a track lock. Should the light be overlooked by a train and fall over, it sends a radio signal to the alarm station. The alarm station warns the construction staff, as well as the train drivers visually and above all acoustically with up to 146 dB. In addition, the market leader from Switzerland offers a comprehensive portfolio in the field of temporary lighting. Its slow-speed lights (Railamp) and train-closing lights (Railstop) will also be shown for the first time.
