p-RCM – A breakthrough technology powering predictive maintenance

Innovative dashboard - 100% surveillance of asset health

Prognostic information to reduce unplanned maintenance

p-RCM provides an improved, data driven approach to obtain RCM benefits; minimising service interruptions and the associated costs due to unplanned downtime. p-RCM utilises advanced data driven algorithms and anomaly detection techniques that do not require threshold setting to provide industry proven diagnostics and risk-based forecasting of remaining useful life, enabling the dynamic scheduling of maintenance across a range of assets. p-RCM ensures 100% surveillance of asset health 100% of the time, allowing rapid identification of potential asset health issues. The novel and easy-to-understand HMI provides actionable information that enables engineers and planners to assess information without the need for detailed analysis of the data.
