Bozankaya DC charging system

Bozankaya tram DC charging system

Bozankaya tram with DC charging

Bozankaya's electric buses are distinguished by their long range due to the company's proprietary battery and battery management system (BMS), a result of Bozankaya's extensive R&D investments. Bozankaya has developed catenary-free vehicles by integrating the battery packs and BMS technology in its trams and trolleybuses. Modern intra-city mass transportation typically requires supporting infrastructure like catenary, masts, transformer substations and others. This may be particularly challenging in areas with historical buildings, streets or other infrastructural limitations. Bozankaya's proprietary, high-performance battery packs, BMS and catenary charging modules allow trams and trolleybuses to pass through such areas without any additional construction work for catenary, allowing the integration of these areas into a modern mass transportation network.
