Real-time passenger information services in the vehicle

DiLoc|OnBoard – route map

DiLoc|Sync – split screen

Keeping passengers up-to-date at all times about punctuality and connections is a key success factor for transport companies. CN-Consult is setting new benchmarks with its hardware-independent DiLoc®|OnBoard software: vehicles are supplied with data in real-time from a central system such as DiLoc|Motion or third party systems via the open Mobile Passenger Information interface developed in-house. The adapter concept created for this purpose integrates both existing and innovative hardware with current network standards. This guarantees requisite security of investment despite increasing complexity of mobile passenger information systems and the fact that lifecycles of hardware components are becoming shorter. DiLoc|Sync software currently supplies over 18,000 drivers throughout Europe electronically. Automated reception and distribution of daily speed restriction zone updates are new, as is the PDF reader, which allows two documents to be shown next to each other (split screen).
