New electronically controlled seat for train drivers

New generation of train driver seats

ISRI and SKA seating specialists are working together on new generation of train driver seats, which has been optimally tailored to the wishes of rail vehicle operators. The developers based their orientation on the "Driver Seat Policy Document" of the GDL professional trade union. Particularly noteworthy is the partially electronic operation of seat adjustment functions as well as the ergonomics of seat and backrest cushions, which have been designed in accordance with the ergonomic aspects specified in the ISO TSI LOC & PAS. An integrated compressor allows the seat 7560KA/885 NTS2 to be used in rail-mounted vehicles that do not have their own compressed air supply.
