SensorSafe Rail Range

GKD will be showing the newly upgraded 3RCi+ system - the latest version of the world's most popular retrofit RCI for road rail applications. Slew limits, virtual walls and height limits are included, featuring selective intelligent hydraulic motion cut of any boom or slew function at limit to prevent movement further into danger. The 3RCi+ also features a touchscreen display inside the cab where the operator can see the details about the machine. Also new is the additional SpaceGuard feature for the 3RCi+ which has dual sensing for extra accuracy and protects against system sensor malfunction, inconsistencies and electronic failures. This feature certifies the RRV to work adjacent line open and under live overhead wires. New gyro tilt sensors provide a true clean angle of the excavator boom.
