Additional mobility service for public transport

moovel on-demand product: Rider App, Driver App and Operator Dashboard

The moovel on-demand ridesharing platform helps transport providers to extend their networks dynamically through intelligent journey management ("routing") and the grouping of journey requests ("pooling") to flexibly adapt their services that meet customers' needs. Using advanced algorithms, moovel on-demand enables transport providers to manage and utilize their operations more efficiently. The solution can be incorporated seamlessly into existing local transport services, making it a valuable tool in the ongoing development and expansion of any transport network. moovel acts as a partner to cities, transit authorities, and end customers.
