

Stationary display for stops with e-paper technology

InfoStation pilot project BVG Berlin

Public transport offers passengers more and more comfort. Even at infrequently used or remote stops the passenger should be optimally informed. This includes information in real time about departure times, delays and disruptions. Further information can be network plans and advertising. The InfoStation from MG Industrieelektronik was specially developed for these requirements. Many stops are in places where a power supply is possible only with considerable effort. In combination with a solar module, the system is independent of an external power supply. Intelligent energy management reduces power consumption. With its high resolution, the display corresponds to a paper printout and ensures very good readability even in different light conditions.
