## Enhanced UFHO system

The background system is the heart of UFHO application in which all data converge

No more queuing when buying tickets: the UFHO subscription module with web interface saves waiting

The software manufacturer AMCON presents the enhanced UFHO system with new subscription management for transport companies. Due to the UFHO subscription module with web interface, customers, schools and companies don't need any special software to create and manage data, or to check and grant fare subsidies, because everything happens externally via the Internet. Customers can register online, select the desired ticket, enter the start, stop and the bank details. The respective authority or school receives information about a new ticket selection, can verify the data and make a decision on authorization and subsidy. All data enters the UFHO background system and is further processed there.
