Safety and tracking system

Locomotives, freight and passenger trains

Freight train and railway construction

CPC Tracking premieres its safety and tracking system for railway construction and transport at InnoTrans. High-quality embedded and ruggedized controllers measure a wide range of data from rolling stock equipment in real time and present these for management. The system has proven its value on large railway construction projects and leading goods transport companies, supporting management in monitoring both own equipment and equipment from sub-suppliers. Constant focus on improving safety and optimizing cost is the driver for CPC Tracking in close cooperation with the customers, to continue supporting project management in making decisions based on reliable data.
