

Surge protection always safely dimensioned

DEHNGuard ACI – delivery start in autumn 2018

The new ACI Technology (Advanced Circuit Interruption) improves the safety of electrical systems. The switch-spark gap combination in the DEHNGuard ACI type 2 arrester makes upstream fuses superfluous. A further bonus: One avoids possible configuration errors made when selecting and dimensioning a suitable backup fuse. The new ACI arresters also have much better TOV resistance, this reduces the risk to the system and avoids wasting time and money on repairing unnecessary damage. With an ACI arrester there are no leakage currents which might lead to premature ageing, even in networks with voltage fluctuations.
