Indra transforms and builds the mobility of the future

Indra leads transport digitization through its strong commitment to innovation. As part of the highest governing body of Shift2Rail, it contributes its technological and digital capabilities and experience in railways and many other industries. Particularly noteworthy is its role in the IP4 programme, with projects like Connective, which position the company as a European benchmark in interoperability technologies applied to transport at a pan-European level. It is also involved in IP2, for the development of advanced traffic management systems, and in IP5, in the search for a more efficient, sustainable and competitive goods transportation. Indra is also positioned as a leader in new smart and reliable IoT technologies, barely exploited until now in the railway sector due to the high demand for safety, but with a high growth potential.
