JetMaster process gets support with SpeedMaster

Cleaning of bogies using SpeedMaster

The JetMaster system from mycon GmbH has been used successfully for years to clean lamellar heat exchangers and other sensitive surfaces. Kipp Umwelttechnik GmbH, sister company of mycon, has now developed another process for cleaning even viscous grease layers: SpeedMaster. The process works just as gently as the JetMaster system. SpeedMaster can be used to clean bogies in the railway sector, the inside of tanks, but also to clean pipes, bars and profiles. The cleaning agent is completely recyclable. The release of the new process for all applications is scheduled for September 2018.
