Green functions app and ordering portal for train path requests

The "Green functions of train movement control" app from DB Netz AG provides train drivers on their tablets or cell phones with messages that help them adopt a capacity-neutral, energy-saving and anticipatory driving style. The train movement control messages are sent from the DB Netz operations centers via an interface to DB Systel. From there the processed travel movement control message is sent directly via push to the locomotive tablet or cell phone with Android operating system. Click&Ride is the DB Netz AG ordering portal for train path requests in ad-hoc rail freight transport in less than three minutes. Click&Ride enables railway undertakings involved in rail freight transport to create train path requests for typical ad-hoc traffic in no time at all and to receive offers in less than three minutes. From these offers the customer can then register a binding train path on a computer, tablet or smartphone.
