Intelligent Mobility 2025: Digital future of transport

Intelligent Citywide Surveillance: image analysis technology based on Artificial Intelligence (AI)

Mobility is changing sustainably in times of digitization - with far-reaching effects on urban life in the future. At InnoTrans, visitors learn how Fujitsu technologies transform cities into smart cities. How the SPATIOWL platform integrates a wide variety of transport data using big data and cloud computing. How the flow of traffic can be channelled through video tracking of goods flows and people, for example. And how the analysis of parking space optimizes the space available in the cities.
