Comprehensive solutions to support the operation of e-buses

With its extensive range of integrated products that cover the full scope of operational processes, INIT is the ideal partner to guide PT operators through to a well-planned and successful launch of electromobility in your operations. INIT will present its latest, comprehensive solutions to support the operation of e-buses at InnoTrans: The MOBILE-PLAN planning system can be used to calculate the effects of changes in the electric bus fleet on costs and personnel requirements through various services simulations. The MOBILE-ITCS (intermodal transport control system) can display information such as the current charge level and the remaining range of each vehicle. The MOBILEopti² optimisation tool accommodates the different requirements of e-buses when compiling blocks. The MOBILEcharge charge management tool makes it easy to control parallel and automated charging processes in the depot.
