Supply chain visibility platform for railway freight

Multimodal terminal optimized with Everysens

Logistics is still a black box for industrials and freight forwarders. With a wide variety of stakeholders and many scattered data sources, rail transport is particularly exposed to lack of visibility. Too often, this affects rail efficiency and quality. Everysens designed a real-time tracking and optimization software to provide complete operational visibility as well as strategic business analytics. This SaaS platform transforms tracking data into actionable information to improve assets' fleet and flow management. Through new supply chain use cases, the clients boost their quality of service (reactivity, punctuality) and benefit from productivity gains. With the largest connected industrial fleet, Everysens is the leader on the French railway market.
