**INNOVATIONS
AND TRENDS**

Vespucci technology automatically merges all data, documents, equipment and multimedia contents as well as all linked objects relating to a linear infrastructure into a super technical Google street view environment. All personnel involved can explore it from the office and share their documents directly: everybody has a global view of the infrastructure. Study plans become interactive: the entire linear project can be viewed simply by clicking on it. Vespucci logs all information, so the evolution of the infrastructure can be traced, before/during/after situations for the respective work phases can be compared. Vespucci also runs on a Windows Pad, so new information can be added on site via a simple, intuitive, efficient interface.
