New anti-panic lock for driver's cabin with self-locking bolt

New anti-panic lock with self-locking bolt

Dény Security's experience in the railway sector, both in the French and European markets, and its knowledge of the specific technical constraints on rolling stock have enabled it to develop a complete range of panic locks that meet the current challenges of securing the cabins, which are to avoid malicious intrusion when the train is stopped, and protect the driver while securing the driver's cabin at the other end of the train when the train is moving. This new range of panic locks is equipped with a self-locking bolt which remains perfectly in place once the door is closed, even in case of attempted intrusion or despite the vibrations of the train. This innovative new technology guarantees greater resistance to intrusion and optimum security.
