Punctual, safe departure thanks to efficient passenger distribution

Upper deck – Display of fullness level for the BVG, Berlin's public transport company

LAT Funkanlagen-Service plans and installs fullness level indicators for buses, trains and trams. From passenger counting (or video analysis) to monitors, the company offers systems with which passengers can be guided to seats. For example, passengers on the lower deck of a bus can see on a monitor how many seats are available on the upper deck. An additional video image lets them know if it is worth the effort to go up. Passengers are motivated to spread themselves out and to avoid crowding in the lower deck, particularly in the entrance area. As a result, buses can be loaded efficiently, passengers are distributed more quickly and departure delays are avoided. In addition, passenger safety is increased (through seat distribution).
