Robust lifting technology

The systems offered by Lock include work platforms for train maintenance

Based on Lock's modular product system work platforms can be realized

At InnoTrans 2018, Lock Antriebstechnik GmbH will exhibit system solutions for elevating and working platforms – also with personnel transport, e.g. for train maintenance. All based on Lock's modular product system, ranging from manually operated rack winches and rack gear units to extremely robust electrical rack winches and drives. Lock drives provide sufficient power-reserve in dynamic and static mode. These products make a light handling at rough environmental conditions, e.g. extreme temperatures and high humidity. Years of expertise and smart control technology enable Lock the construction of application-specific systems from these modules, capable of vertical, horizontal, tilting and rotating movements.
