Data management and analysis system TracksNet™

DMA TracksNet™

TracksNet™ is an innovative integrated data management and analysis system from DMA. It is the only truly open database for infrastructure measurements; the data is stored in an open and documented format. The web-based application is flexible and customizable, which allows to save time and easily access real-time data. Users can manage thresholds, validate defects, and generate reports with just a few clicks. TracksNet™ can integrate data from any source and also fully integrates with existing asset management systems, including IBM's Maximo and SAP. TracksNet's™ modular display system allows to drag and drop, hide, and resize visualization components for a personalized interface which can be saved and reused. Authorized users can customize strip charts and displays in real time and export defects and data into multiple formats.
