Interactive harness assembly board

Automatic marking and cutting production line

Laselec's EasyWiring interactive harness assembly boards bring modernization to electrical harness building through the use of software that guides the operator through the entire process. Benefits are readily realized and include increased productivity, reduction in training time and traceability. It even reduces the risk of an error and trims the time spent on prototyping. The company is pleased to launch a new version of the automatic marking and cutting production line at InnoTrans. With RapidShare Wire by Wire, a label with all the necessary information can be affixed at both extremities of the cables. While marking a cable, this system can handle other tasks simultaneously: cable taping and grouping, bundle labeling, bin loading, and bin divider insertion.
