Self-locking fixture for thermal insulation half-shells

Self-locking fixture for thermal insulation half-shells

This newly patented quick-connect system for rigid insulation half-shells enables users to significantly reduce assembly time on the part to insulate. Assembly is effortless and safe for operators, while no specific tool is required. Setting of this quick-connect system on the stainless steel outer skin of insulation products by spot welding or riveting ensure the wholeness of the insulation shells. Removal of the metallic strip is blocked by the ball located inside the attach system. Tensile strength is about 20% higher than typical attachment systems by buttons and stainless-steel thread to lace up.
