New generation of compact brake valves

DAKO CZ presents the new generation of compact brake valves MEMU, in which all the necessary features are integrated, including control electronics with SIL 2 to control the brake systems on metro and suburban trains. One of the main advantages of the new DAKO CZ product is that the brake valves are considerably smaller, reducing its weight. The compact design of the system as a whole, with integrated auto-diagnostic control electronics built in, greatly simplifies maintenance of the MEMU. The MEMU will be available to customers from the end of 2019, and will expand the DAKO CZ portfolio of brakes for metro trains and suburban electric units. Metro cars fitted with DAKO brake systems are in operation in cities such as Oslo, Munich, Warsaw and Kuala Lumpur.
