Innovative solution for the assembly and installation of prefabricated crosscut closures in tunnel

Basically, this Plug-in Crosscut Element (PCE) system functions in every kind of cross-connecting gallery. A prerequisite for a smooth execution is a corresponding project planning during the shell construction planning as well as a 3-D laser scan of the cross-cut ends. The transport of the PCE in the tunnel can be done rail-bounded in case of a railway tunnel or on a flatbed trailer. An animation video provides the fabrication process, the transport and the installation workflow of the PCE is shown step by step.
