Patented Edscha TS sealing system and Railway OpenBox

Flexible and clip-on sealing systems

The future-oriented roof solution for E-wagons

The new Edscha TS sealing system for the initial and retrofitting of all wagons of the Shimmns and Rilns classes with standard covers eliminates the problem of leaks and saves the shipping companies the high consequential costs. These rubber profiles, developed and presented as a world premiere by European Trailer Systems are easy to retrofit, even on older wagons with corresponding signs of wear. The patented clip system can be mounted on every bow form at any time. No rivets, adhesives or special tools are needed – just press into place and that's it. Another world premiere for open freight cars in the standard design E - known as the Railway OpenBox – will be presented at InnoTrans. With this innovation Edscha TS is signalling the end of time-consuming and hazardous covering work with loose tarpaulins. This roof can be operated by one person and only weighs about 300 kilograms over a length of ten metres, thus guaranteeing greater cargo load.
